

Performance Testing

Date	03 October 2026
Team ID	SWTID-2026-8726
Project Name	Auto Ticket Classification using FLOW DESIGNER
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how the Auto Ticket Classification workflow behaves when processing Incident and Service Request tickets. The test focuses on workflow response, classification/routing behavior and the system-level performance information documented for the project.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Flow Designer / ServiceNow workflow execution. A dedicated JMeter, Locust or k6 tool is not documented for the current project.
Type of Testing	Workflow Performance / Response-Time Testing and functional load-oriented scenario validation.
Target Module / API	Auto Ticket Classification Flow Designer workflow for Incident / Service Request creation, classification and routing.
Test Environment	Configured ServiceNow development / evaluation instance.
Test Date	03 October 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Single ticket creation → automatic Flow Designer trigger → classification and routing.	1	Not documented	Workflow should trigger and complete classification/routing without unnecessary delay.
2	Multiple representative tickets for different categories and assignment groups.	Not documented	Not documented	Each ticket should be classified and routed according to configured rules.
3	Unmatched / ambiguous ticket submitted to test fallback handling.	Not documented	Not documented	Ticket should reach General Support Triage Queue for manual review.
4	End-to-end ticket processing including classification, priority and assignment-group update.	Not documented	Not documented	Complete workflow should execute successfully and retain ticket/audit information.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	1.2 seconds	Pass	Documented project result for average triage time.
2	Response Time (Max)	< 5 seconds	Not documented	Not Reported	Maximum response time was not provided.
3	Throughput (Req/sec)	To be measured	Not documented	Not Reported	No requests-per-second measurement was documented.
4	Error Rate	< 1%	Not documented	Not Reported	No quantitative error-rate result was documented.
5	CPU Utilization	< 80%	Not documented	Not Reported	CPU utilization

					measurement was not documented.
6	Memory Utilization	< 80%	Not documented	Not Reported	Memory utilization measurement was not documented.

Step 4: Observations & Analysis

Key Findings	The documented project result reports an average triage time of 1.2 seconds. The automated workflow reduces manual triage effort by evaluating ticket information and routing the ticket through configured Flow Designer conditions.
Bottlenecks Identified	Rule-based classification may require manual review for unmatched or ambiguous tickets. Detailed CPU, memory, maximum-response and throughput measurements are not documented.
Optimization Steps Taken	Use conditional workflow branches for classification and routing, provide a fallback triage queue for unmatched tickets, and review workflow execution/audit records. Further load testing is recommended for quantitative capacity metrics.

Step 5: Screenshots / Evidence

Attach screenshots of ServiceNow Flow Designer execution, ticket classification/routing results and any available performance or execution logs.

[Insert Flow Designer Execution Screenshot Here]
[Insert Ticket Classification / Performance Evidence Screenshot Here]

Note: The supplied template contains response time, throughput, error rate, CPU and memory metrics. Only the 1.2-second average triage result is supported by the available Auto Ticket project material; unsupported metrics are marked Not Documented rather than inventing values.
